Day 4 - Building Dynamic Frontend Components for Shop.co

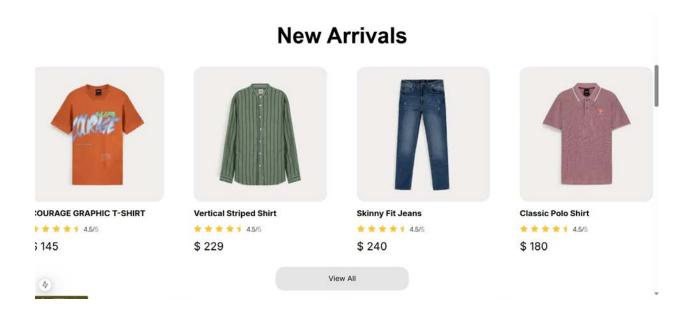

```
import fetchProducts from "./data"; // Import your fetchProducts function
                                          import Card from "./card"; // Import the Card component
import { Product } from "../../typings";
import Link from "next/link";
> productDetails
                                            const [products, setProducts] = useState(Product[]>([]); // State to hold the fetched products
* favicon.ico
                                             const getProducts = async () => {
# globals.css
                                               const data = await fetchProducts(); // Fetch products using the asynchronous function
                                                console.log(data)
v components
                                             getProducts();
 arrivals.tsx
dressStyle.tsx
footer.tsx
                                                happyCustomers.tsx
                                                   ch1 className="pt-5 font-integral text-[48px] font-bold leading-[57.6px]
                                                    New Arrivals
```

Data is fetched from sanity and displayed in arrivals component, I have made different components for different categories so my main page.tsx file is very easy to understand.

Here is the dynamic data displayed on my website

As data is more and my Ui need to display only 4 items in new arrivals category, I used slice method to get only 4 first items of my sanity data.

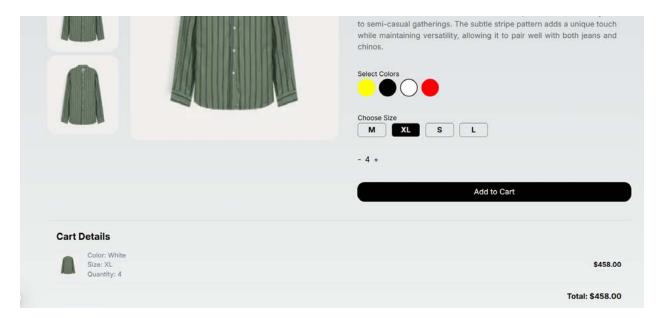

I created a dynamic routing for all products so when user clicks on a single product he will lead to productdetails page .

Now I used usestate and use effect for controlling the data and set add to cart functionality in it

So user can select size, color, and number of products.

Now the products data is collected in cart dynamically

Notifications

When user clicks on add to cart it, displays a notification that the products is addred in the cart

On the bottom cart details are also displayed

```
const handleAddToCart = () => {
    const newCartItem = {

        image: product.imageUrl, // Ensure correct property is used
        color: selectedColor,
        size: selectedSize,
        quantity,
        totalPrice,
        };

    setCart([...cart, newCartItem]); // Update cart state
        alert("Item successfully added to the cart!");
    } else {
        alert("Please select a color, size, and make sure the product is loaded.");
    }
};
```

Payment system:

We'll learn it after hackathon3

Authentication:

We'll learn it after hackathon on class
